Global IUCN Red List Category —

Criteria —

Pandion haliaetus is a widespread summer visitor to much of northern Europe (occurring only patchily farther south), which accounts for less than a quarter of its global breeding range. Its European breeding population is small (as few as 7,600 pairs), but increased markedly between 1970–1990. Most European populations increased or were stable during 1990–2000, and the species underwent a moderate increase overall. Nevertheless, its population size still renders it susceptible to the risks affecting small populations, and consequently it is evaluated as Rare.
